Multiple choice poll

Do these results reflect your experience with the REC Theft Calculators?

0 1 5

Yes

100 %

No

0 %

Do you experience other challenges that have not been discussed today? If yes, please tell us what they are.

008

- All concerns already shared
- All points have been addresses
- No
- No
- No
- No, the points shared covered all concerns
- No
- No

Are there other improvements that could be added to the REC Theft Calculators?

005

- Agree that alternatives should not include macros on excel that have been identified as cyber security risk on other templates used across the industry
- Can't think of anything further than what was already submitted on initial survey
- Xoserve are currently reviewing their Theft calculator, collaboration with them for a universal theft tool
- Could the Regions be changed to match the ECOEs GSP groups so that we can better match them to the right area of the country
- A general point, which I assume will be looked into as part of development, is that the calculator should not exist in the from of an excel spreadsheet, as it is too restrictive a format across devices.

Are there any other comments or feedback on this Issue you would like to share?

003

- Will we be considering a matrix for fines rather than calculating individual site usage?
- Appreciate that this is being looked into, as the theft calcs are an area of energy theft which are stifled in terms of innovation due to the mandatory use of the excel spreadsheet and the minimal updates made over the years
- Not currently but would be good to see what improvements are made and can then suggest further improvements possibly in another workshop call like this one
